

The wholesale market report and the annexes showcase important historical data for the wholesale UK electricity and gas markets: Demand levels, trading volumes, prices and generation makeup. This report will be produced monthly for data from the preceding month. This report should not be used for trading, does not attempt to produce information on individual commercial strategies and does not provide forecasts or daily prices.

Key figures

- GB transmission connected demand stood at **0.65 TWh/day** for power and **1.81 TWh/day** for natural gas in July.
- The churn ratio for electricity was **3.44** and the churn ratio for gas was **10.24** in July.
- In July, the power delivered to the UK grid was generated by:

Gas power stations: 46.84%

Nuclear: 18.18%

Wind: 12.19%

Biomass: 6.49%

Coal: 0.12%

Interconnectors: 7.33% net with **4.53%** from France, **2.16%** from the Netherlands and **1.67%** from Belgium

Solar: 7.00%

Hydro: 0.98%

- Over July, the average daily price for power was **£40.76/MWh** and the spot price for gas was **29.94p/thm**.

Note: *Other* includes pumped storage, hydro, oil, CCGT, tidal, battery and CHP.

Trading

This graph shows the traded volumes of different types of contracts to deliver to the respective months set against demand.

Total traded electricity delivered in the last 3 months (TWh/day)

Natural gas traded and delivered to Grid by delivery month (TWh/day)

Source: National Grid

Pricing

These graphs illustrate relative to delivery date the difference in price you would have paid purchasing power and gas at different times. They show the historical price movements of spot, month ahead (averaged monthly) and season one, two and four ahead contracts (averaged over a season) for the past two years. For example, at the start of 2016 long term seasonal products were generally more expensive than short term products, whereas towards the end of 2016 the opposite was the case.

Key definitions

- **Baseload:** An amount of electric power delivered or required over a given period at a constant rate.
- **BEIS:** Department for Business, Energy and Industrial Strategy.
- **Churn ratio:** Here means the ratio for a specific time period between; volumes of trades to deliver on that period and; the total demand over that period. Typically, volumes traded are over 10 to 20 times demand in the gas wholesale market, whereas for the electricity wholesale market the ratio is typically less than 4.
- **kWh:** Kilowatt-hour, a unit of energy equal to delivering 1kW for an hour, which is commonly used for retail pricing.
- **LEBA:** London Energy Brokers' Association. The members of LEBA facilitate bilateral trades between parties, termed Over the Counter (OTC) trades.
- **Liquidity:** A liquid market is one where there are ready and willing buyers and sellers and where what is being bought and sold is easy to price and can trade without a significant price impact. Liquid markets are ones where there is a high turnover and where volumes traded are significant.
- **LNG:** Liquefied Natural Gas. Natural gas is easier to transport in liquid form if a pipeline is not available as it requires less space.
- **Month ahead:** Electricity traded for delivery in the next month.
- **NBP (National Balancing Point):** The virtual hub at which all gas flows onto and out of the gas grid are set against.
- **Season ahead:** trade for electricity delivered in a particular future season – summer or winter.
- **Seasons:** There are two seasons for wholesale energy: Winter which runs from October to March and; Summer which runs from April to October.
- **Thm:** Therm, a non-SI measurement of heat energy which companies use to measure their gas needs. Burning one therm of gas is approximately equivalent to releasing 29.3 kWh of energy (before heat loss).

Background information

In 2018, **final electricity consumption** (excluding losses and energy industry own use) across the economy was 299.65 Terawatt hours (TWh), split across three groups:

Industrial: 93.02 TWh

Domestic: 105.07 TWh

Commercial premises, public administration, transport and agriculture: 101.56 TWh

The average electricity consumption per household in 2018 was 1.0% lower compared to 2017, at 3,831 kilowatt hours (kWh), or 3,861 kWh adjusted for temperature, approximately equivalent to boiling a kettle 35,000 times*.

In 2018, the UK produced 450.21 TWh of **natural gas**, imported 517.88 TWh and exported 83.69 TWh.

438.97 TWh of natural gas was imported by pipelines, of which 373.34 TWh came from Norway, 30.10 TWh from the Netherlands and 35.52 TWh from Belgium. Additionally, 78.11 TWh of liquefied natural gas (LNG) was imported, of which almost half – 31.70 TWh - came from Qatar.

Gas consumption was split by:

Domestic: 309.17 TWh

Industry: 105.41 TWh

Other uses such as non-energy uses, commercial and public: 99.47 TWh

Energy industry use (mainly used for oil and gas extraction): 56.99 TWh

Transformation (mainly used as fuel to produce electricity): 303.01 TWh

The average domestic gas consumption in 2018 was 3.2% higher compared to 2017, at 12,932 kWh, or 13,606 kWh adjusted for temperature, approximately sufficient to boil a kettle nearly 122,000 times*.

*One kilowatt hour is approximately enough to boil a kettle nine times
